1 Overview of proportional flow control valves type SE, SEH

Proportional flow control valves are a type of flow valve. They generate a constant flow rate independent of the load which can be controlled in an electro-proportional and remote way.

The flow control valve type SE has a directly actuated metering orifice, which is advantageous for control operations when Q_{min} is almost zero. The flow control valve type SEH has a pilot-controlled metering orifice which is shown to be beneficial in dynamic systems with short reaction times. The flow control valve type SE and SEH is available as a single valve for pipe connection or as a manifold mounting valve.

Pressure-limiting valves and randomly switchable idle circulation valves are additional options. The flow control valve type SE and SEH controls the operating speed of hydraulic consumers.

Features and advantages

- Electric control of consumer working speeds
- Automation of operating cycles
- Optionally also available with additional valves (bypass check valve, pressure-limiting valve, idle circulation valve)

Intended applications

- Construction machines
- Machine tools
- General hydraulic systems
- Mining machinery

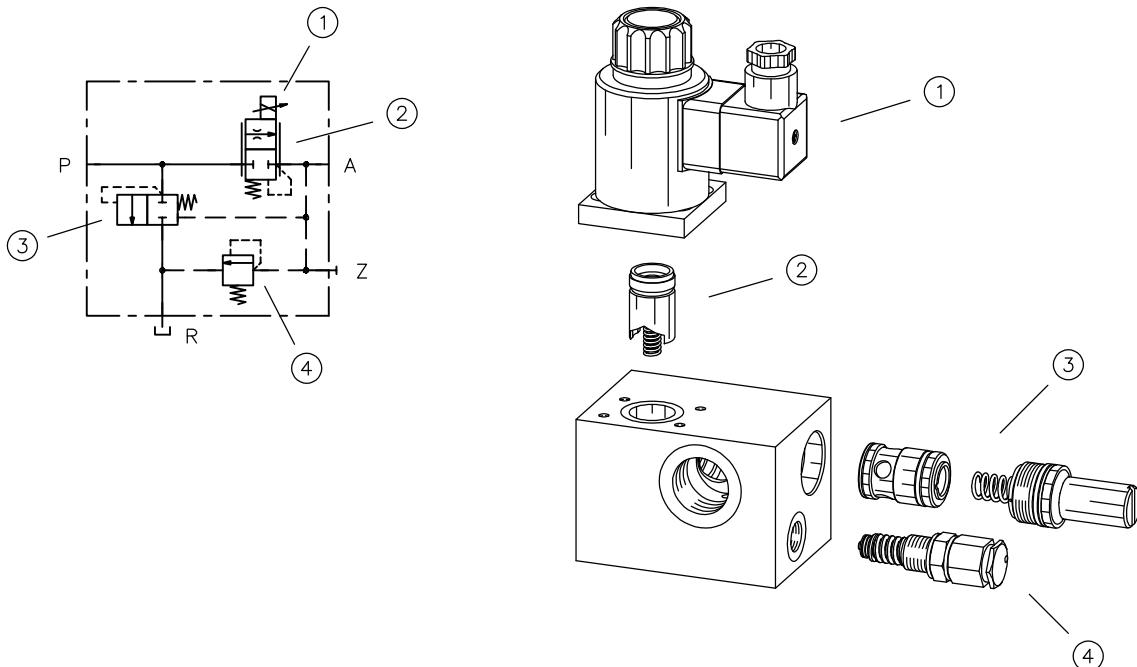

Proportional flow control valve type SEH

1.1.1 Overview of directly actuated flow control valve type SE

see Chapter 2.1, "Directly actuated flow control valve type SE"

Configuration example: SE 3-4/70 S-G 24

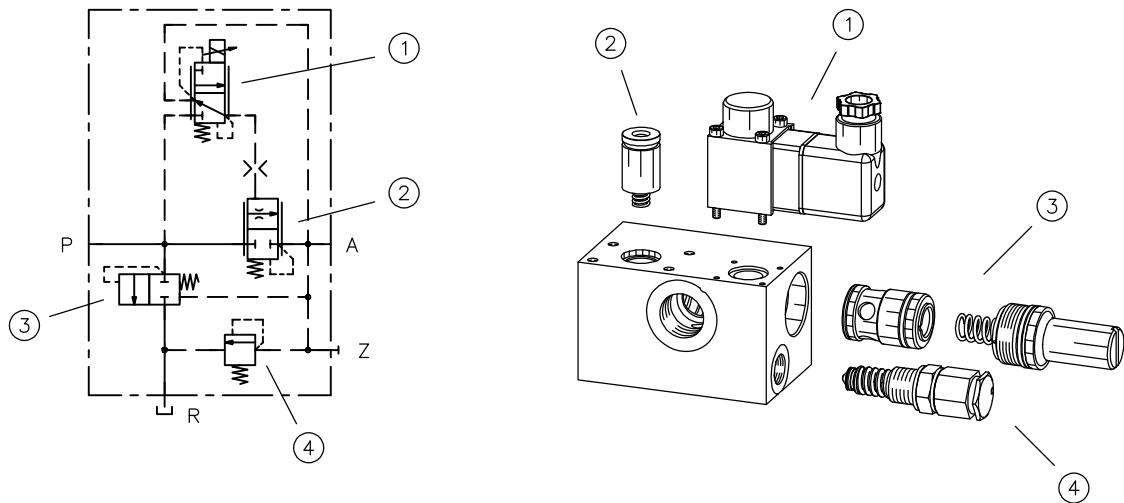

- 1 Proportional solenoid for directly actuating the metering orifice: Advantageous for controlling flow rates of close to 0, [see Chapter 2.1.5, "Solenoid voltage and connector"](#)
- 2 Metering orifice: directly actuated, responsible for the consumer flow in port A; generates a slight pressure drop (measuring pressure) that is required for the control function of the pressure compensator, [see Chapter 2.1.3, "Flow rate range"](#)
- 3 Pressure compensator: consists of a piston and a sleeve with bores; opens at 8 bar to reduce pressure at port P, [see Chapter 3.4, "Characteristic lines"](#)
- 4 Optional pressure-limiting valve as an additional valve to restrict the consumer pressure.
other additional valves [see Chapter 2.1.4, "Model and additional functions"](#)

1.1.2 Overview of pilot-controlled flow control valve type SEH

see Chapter 2.2, "Pilot-controlled flow control valve type SEH"

Configuration example: **SEH 3-3/50F S-G 24**

- 1 Proportional pilot valve type PM according to D 7625 (with solenoid for pressure setting): reduces the pressure at P in proportion to the electrical current signal at the solenoid [see Chapter 2.2.5, "Solenoid voltage and connector"](#)
- 2 Pilot-controlled control orifice (metering orifice): responsible for the consumer flow in port A; its flow cross section is adjusted by the proportional solenoid and it generates a slight pressure drop (measuring pressure) that is required for the control function of the pressure compensator, [see Chapter 2.2.3, "Flow rate range"](#)
- 3 Pressure compensator: consists of a piston and a sleeve with bores; opens at 8 bar to reduce pressure at port P, [see Chapter 3.4, "Characteristic lines"](#)
- 4 Optional pressure-limiting valve as an additional valve to restrict the consumer pressure.
[other additional valves see Chapter 2.2.4, "Model and additional functions"](#)

3 Parameters

3.1 General data

Designation	Proportional flow control valve
Design	Flow control valve
Model	<ul style="list-style-type: none"> ▪ Single valve for pipe connection ▪ Manifold mounting valve
Material	SE, SEH: valve block made of steel, nitrided or galvanised surface SE: solenoid surface electro-galvanised SEH: pilot valve block made of steel, nitrided surface
Attachment	Mounting thread or tapped holes, see Chapter 4, "Dimensions"
Installation position	any
Ports/connections	<ul style="list-style-type: none"> ▪ P = Pump ▪ R = Reflux ▪ A = Consumer outlet ▪ Z = Control port ▪ T = Tank connection: only for the version with a pressure-limiting valve with coding ST, see Chapter 6.3 <p>Connecting thread: SE: see Chapter 2.1.2, "Size" SEH: see Chapter 2.2.2, "Size"</p>
Flow direction	<p>Operating direction:</p> <ul style="list-style-type: none"> ▪ $P \rightarrow A / P \rightarrow R$ ▪ $A \rightarrow B$ or $B \rightarrow A$ for the version with a bridge rectifier <p>Free return flow $A \rightarrow P$ only with bypass check valve</p>
Hydraulic fluid	<p>Hydraulic fluid, according to DIN 51 524 Parts 1 to 3; ISO VG 10 to 68 according to DIN ISO 3448</p> <p>Viscosity range: 4 - 1500 mm²/s</p> <p>Optimal operating range: approx. 10 - 500 mm²/s</p> <p>Also suitable for biologically degradable hydraulic fluids type HEPG (polyalkylene glycol) and HEES (synthetic ester) at operating temperatures up to approx. +70°C.</p>
Cleanliness level	<u>ISO 4406</u> <hr/> 20/17/14
Temperatures	<p>Environment: approx. -40 to +80 °C, hydraulic fluid: -25 to +80 °C, pay attention to the viscosity range.</p> <p>Start temperature: down to -50 °C is permissible (take account of the start viscosities!), as long as the steady-state temperature is at least 20 K higher during subsequent operation.</p> <p>Biologically degradable hydraulic fluids: note manufacturer specifications. With consideration for the seal compatibility, not above +70°C.</p>

3.2 Pressure and volumetric flow

Operating pressure

Ports P, A, Z, R: $p_{\max} = 315$ bar
 Port T: $p_{\max} = 20$ bar

NOTICE

In the case of a 3-way flow control valve, the permissible counter-pressure at port R must always be lower than the prevailing consumer pressure at port A (minimum difference: 8 bar).

Flow rate

SE: Q_{\max} see Chapter 2.1.1, "Basic type"
SEH: Q_{\max} see Chapter 2.2.1, "Basic type"

Pressure setting

100 bar if no other value is specified in the order.
 The pressure setting is the operating pressure at which the set flow rate is set see Chapter 3.4, "Characteristic lines"

3.3 Weight

3.4 Characteristic lines

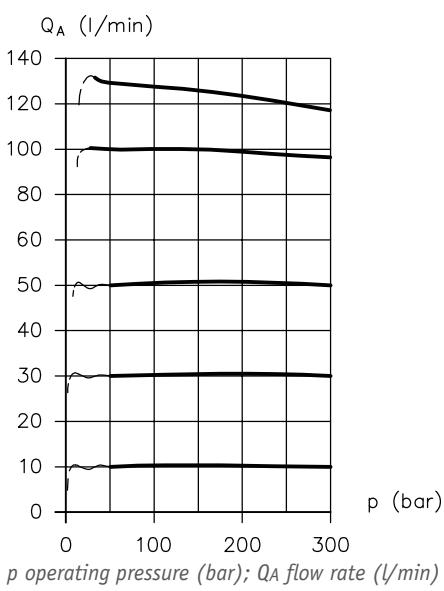

p-Q characteristic lines for 2-way and 3-way flow control valve

Viscosity of the hydraulic fluid approx. 35 mm²/s

2-way flow control valve

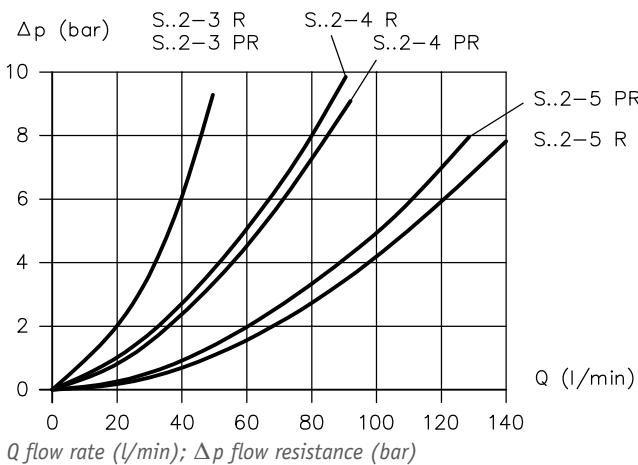

3-way flow control valve

Δp -Q characteristic line for 2-way flow control valve with bypass check valve

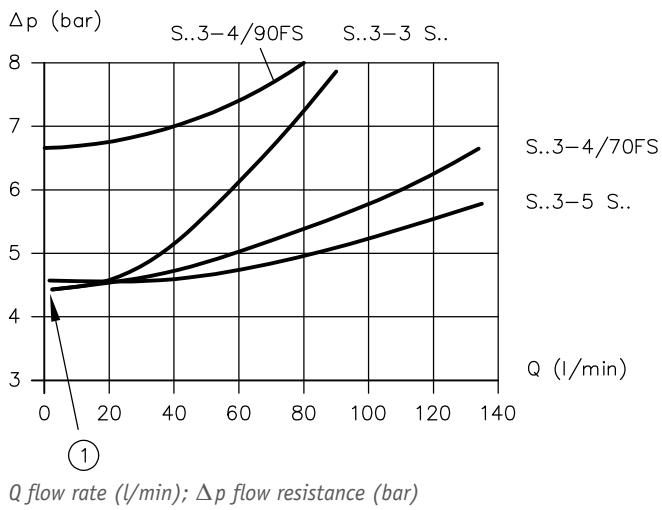

Viscosity of the hydraulic fluid approx. 35 mm²/s

Flow direction A → P

Circulation resistance when load on pressure compensator has been relieved

Viscosity of the hydraulic fluid approx. 35 mm²/s

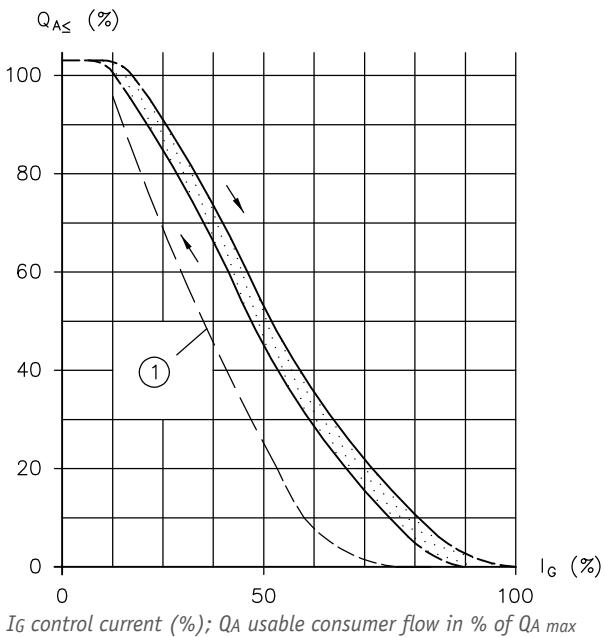

Q flow rate (l/min); Δp flow resistance (bar)

1 Opening pressure

Q-I characteristic line for 2-way and 3-way flow control valve

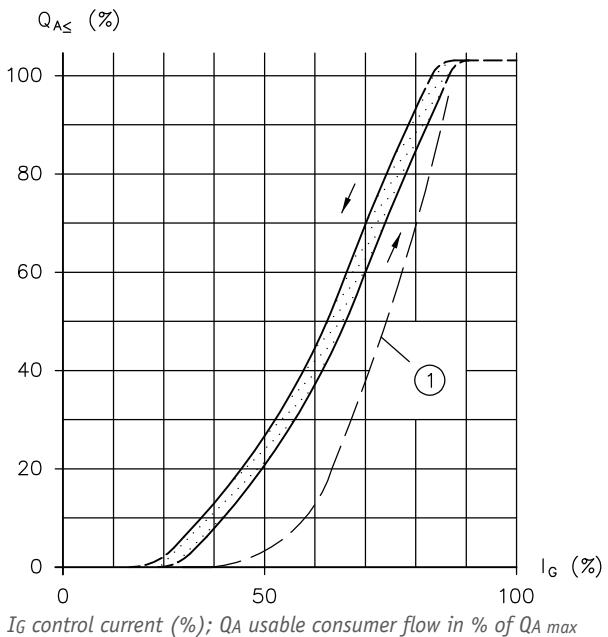

Viscosity of the hydraulic fluid approx. 50 mm²/s

Version with open metering orifice

1 Version with precision control range

Version with closed metering orifice

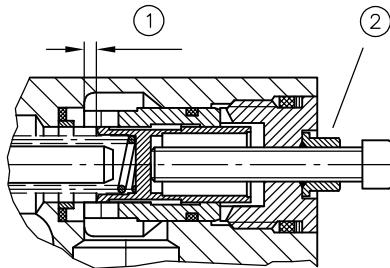

1 Version with precision control range

Precision control range:

The precision control range ends at approx. 0.5 x control current I. The flow rate achieved at that point can be identified from the coding for the metering orifice, see Chapter 2.2.3, "Flow rate range".

Example: SEH 3-2/4/18 F-G 24 (precision control range up to approx. 4 l/min, flow rate Q_{max} = 18 l/min)

Note for the 2-way flow control valve:

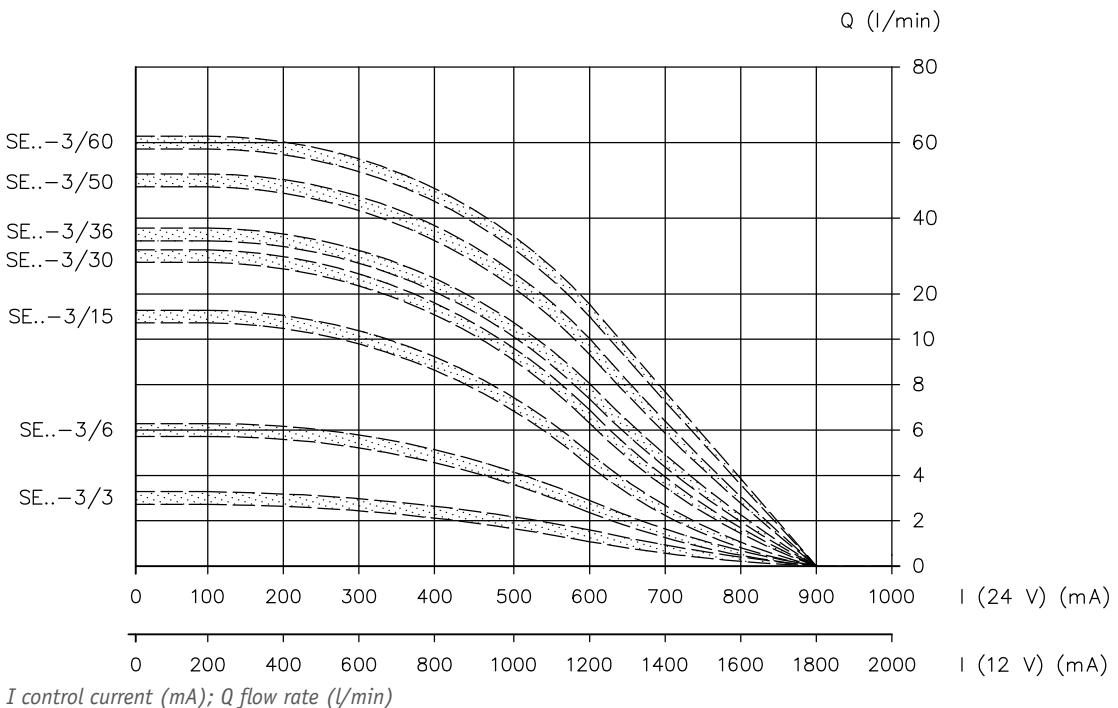

- 1 The initial idle stroke can be shortened using a screw if Q_{pump} < Q_A max. This enables the reaction time and the start-up jump to be reduced. The initial idle stroke is set ex works to Q_{max} in line with the coding for the nominal flow rate.
- 2 Before making adjustments: loosen the lock nut (seal-lock nut) of the set screw sufficiently to prevent the thread from damaging the vulcanised sealing ring.

Q-I characteristic line for directly actuated flow control valve type SE

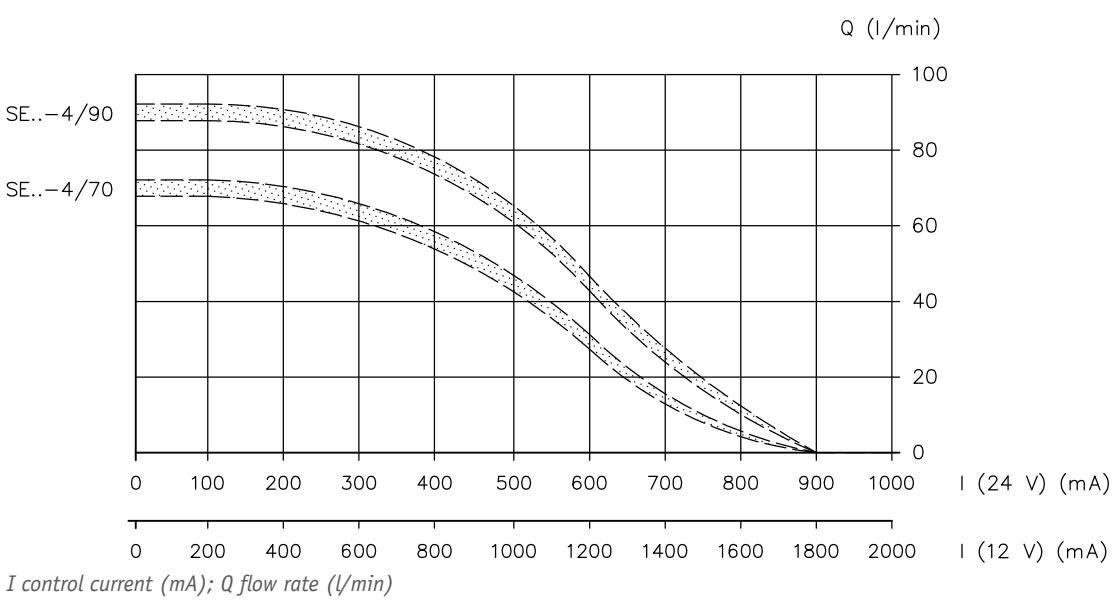

Viscosity of the hydraulic fluid approx. 50 mm²/s

Version with open metering orifice

5 Installation, operation and maintenance information

Observe the document B 5488 "General operating instructions for assembly, commissioning, and maintenance."

5.1 Intended use

This product is intended exclusively for hydraulic applications (fluid technology).

The user must observe the safety measures and warnings in this document.

Essential requirements for the product to function correctly and safely:

- All information in this documentation must be observed. This applies in particular to all safety measures and warnings.
- The product must only be assembled and put into operation by specialist personnel.
- The product must only be operated within the specified technical parameters described in detail in this document.
- All components must be suitable for the operating conditions when using an assembly.
- The operating instructions for the components, assemblies and the specific complete system must also always be observed.

If the product can no longer be operated safely:

1. Remove the product from operation and mark it accordingly.
 - ✓ It is then not permitted to continue using or operating the product.

5.2 Assembly information

The product must only be installed in the complete system with standard and compliant connection components (screw fittings, hoses, pipes, fixtures etc.).

The product must be shut down correctly prior to disassembly (in particular in combination with hydraulic accumulators).

DANGER

Sudden movement of the hydraulic drives when disassembled incorrectly

Risk of serious injury or death

- Depressurise the hydraulic system.
- Perform safety measures in preparation for maintenance.

5.3 Operating instructions

Observe product configuration and pressure/flow rate.

The statements and technical parameters in this document must be strictly observed.

The instructions for the complete technical system must also always be followed.

NOTICE

- Read the documentation carefully before usage.
- The documentation must be accessible to the operating and maintenance staff at all times.
- Keep documentation up to date after every addition or update.

CAUTION

Overloading components due to incorrect pressure settings.

Risk of minor injury. Parts may burst or fly off, and uncontrolled leakage of hydraulic fluid.

- Pay attention to the maximum operating pressure of the pump, valves and fittings.
- Always monitor the pressure gauge when setting and changing the pressure.

Purity and filtering of the hydraulic fluid

Fine contamination can significantly impair the function of the product. Contamination can cause irreparable damage.

Examples of fine contamination include:

- Swarf
- Rubber particles from hoses and seals
- Dirt due to assembly and maintenance
- Mechanical debris
- Chemical ageing of the hydraulic fluid

NOTICE

New hydraulic fluid from the manufacturer may not have the required purity.

Damage to the product is possible.

- ▶ Filter new hydraulic fluid to a high quality when filling.
- ▶ Do not mix hydraulic fluids. Always use hydraulic fluid that is from the same manufacturer, of the same type, and with the same viscosity properties.

For smooth operation, pay attention to the cleanliness level of the hydraulic fluid (cleanliness level see Chapter 3, "Parameters").

Additionally applicable document: [D 5488/1](#) oil recommendations

5.4 Maintenance information

Check regularly (at least once a year) by visual inspection whether the hydraulic connections are damaged. If external leakages are found, shut down and repair the system.

Clean the surface of the device regularly (at least once a year) (dust deposits and dirt).

6 Other information

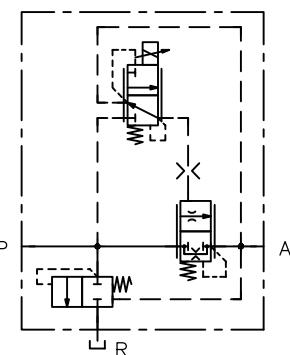

6.1 Version with orifice with coding F0

see Chapter 2.2.3, "Flow rate range", Metering orifice, closed when de-energised with compulsory lock-out circuit for the pressure compensator

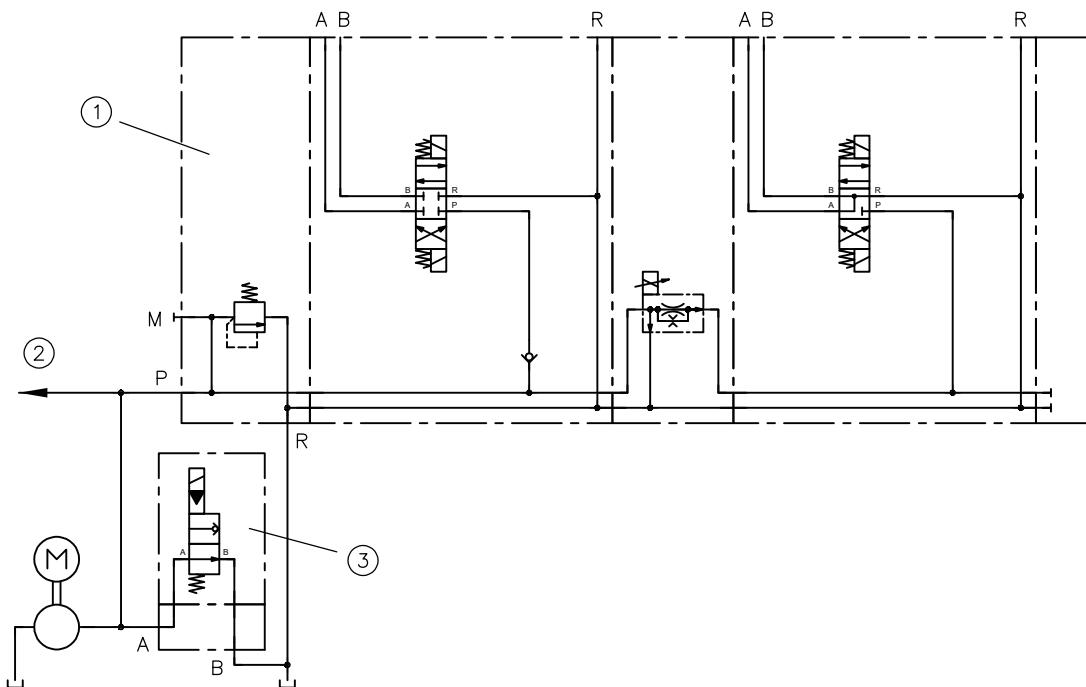

It differs from the standard version in that there is a defined stroke limitation element for the closed F metering orifice in the idle position, which takes the form of a washer (can be retrofitted). The slight residual opening maintains a connection from the P-side to the A-side and thus to the rear of the pressure compensator (spring cavity).

This compensates for leakage-related losses from the spring cavity to R when the directional spool valves or directional seated valves that are connected at consumer side A are not actuated and in the closed centre position. As a result, a pressure balance is maintained between the pressure compensator's control side (front side) and rear side.

The pressure compensator is forced closed by the spring force (outlet R) and remains there, or immediately moves from a previous control position into the closed position, ensuring it does not disrupt the oil supply to the hydraulic circuit ahead due to outlet R closing too slowly or not at all.

Circuit example

1 Auxiliary circuit with e.g. SWS 2 A6-G/M/R/02-ZSE 15 F-D/M/0/02-1-G 24-200 according to D 7951.

In this example, the pressure-limiting valve safeguards the pressure of both circuits jointly.

2 To the main circuit with e.g. directional valve banks with closed centre position SWS on the P-side.

3 Seated valve, e.g. EM 11 S-3/8 according to D 7490/1 as idle circulation valve.

Application

Enables a controlled supply of pressure oil in hydraulic circuits that are connected in parallel, instead of the 2-way flow control valves that would otherwise be required for these kinds of circuits.

Example:

Provides a variable supply of pressure oil to an auxiliary circuit which is branched off from a main circuit that has a constant supply of oil. The pressure compensator is forced into the closed position when it is not actuated, i.e. when the directional valves belonging to this (auxiliary) circuit are also in the closed neutral position. This enables the consumers of the upstream constant flow (main) circuit to be actuated without any disruptions caused by the pressure compensator adopting uncontrolled positions that result in a loss of oil towards port R.

Advantage

Only the lower power loss associated with a 3-way control concept occurs in the auxiliary circuit. The residual flow of oil is only returned to the tank against the current consumer pressure. In the case of a conventional 2-way control system, the residual oil is discharged to the tank via the pressure-limiting valve and subject to the maximum pressure set there, which results in a higher power loss.

Restriction

Must not be actuated at the same time as the upstream hydraulic (main) circuit. Compared with the standard version, the slight opening of the control cross section on the metering orifice slightly increases the minimum usable consumer oil flow $Q_{A\ min}$ that can be achieved.

INFORMATION

The metering orifice is slightly open in the neutral position.

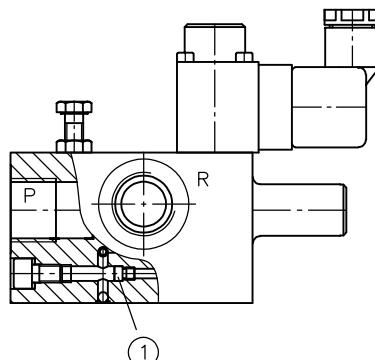

6.2 Version with bypass orifice with coding B 0.6

see Chapter 2.2.4, "Model and additional functions"

If a bypass orifice of $\varnothing 0.6$ mm is fitted between A and R, then when the metering orifice is closed (proportional solenoid is de-energised), the pressure is quickly reduced on the A-side (consumer) and thus also in the control or spring cavity of the pressure compensator. This enables the pressure compensator to switch to idle circulation (against the controller spring pre-tension of approx. 6 bar).

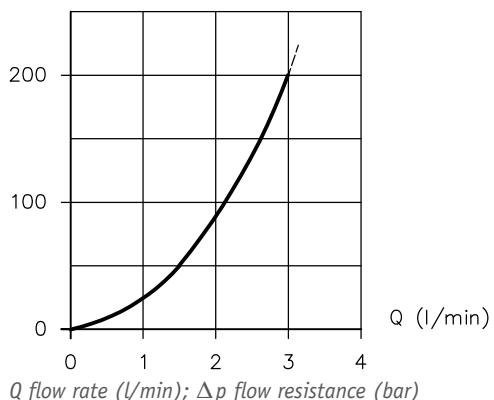

The orifice B 0.6 can be accessed from port A (after removing the HAWE tapped plug with O-ring 4x1 NBR 90 Sh), meaning the user can also retrofit it themselves after removing these parts (standard carburettor orifice M4 x $\varnothing 0.6$).

Depending on the consumer pressure at port A, the flow rate according to the Q-l characteristic line, [see Chapter 3.4, "Characteristic lines"](#), is reduced in line with the adjacent bypass flow rate.

1 Orifice of $\varnothing 0.6$

Δp (bar)

Application

Enables automatic switchovers, even if the consumer at A is blocked. This negates the need for the 2/2-way solenoid that would otherwise be required.

Restriction

Not suitable for control systems where a load-induced back pressure (e.g. weight load in the case of single-acting hydraulic cylinders) from the consumer acts on A. This load-induced back pressure can be blocked using an external check valve (e.g. RC1-E in A).

INFORMATION

In normal operation, a certain amount of the consumer's usable volume flow is continuously drawn via the orifice, depending on the current pressure at A / R.

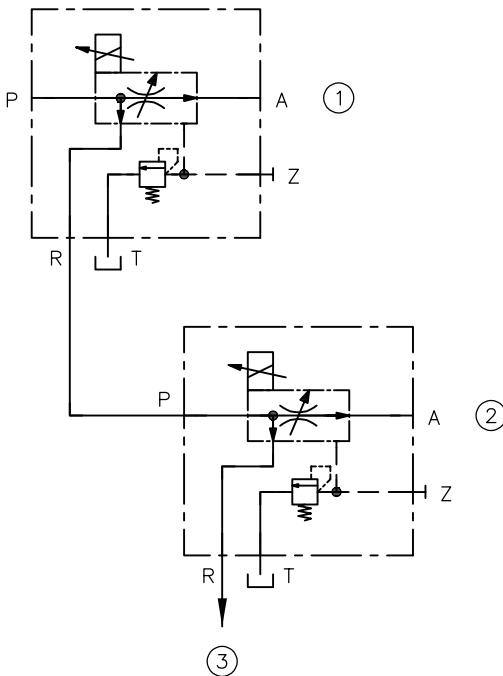

As a result, this has a slightly negative impact on the load independency [see Chapter 3.4, "Characteristic lines"](#).

6.3 Version with a pressure-limiting valve with coding ST

see Chapter 2.2.4, "Model and additional functions"

The outflow oil from the pressure-limiting valve is discharged via a drain port T that must be connected separately. This ensures that the pressure setting remains independent of the current pressure at port R.

Circuit example

- 1 Consumer 1
- 2 Consumer 2
- 3 Other consumer or tank

6.4 Version with additional proportional pressure-limiting valve

By connecting a proportional pressure-limiting valve type PMV 41-4./.. or PMVP 4-4./.. at the control port Z of 3-way flow control valves (with an integrated pressure-limiting valve with a fixed setting), it is possible to proportionally control both the flow rate and operating pressure and, when de-energised, achieve idle circulation P → R of around 8 to 10 bar (applies to flow controllers with open and closed orifice).

The existing pilot pressure-limiting valve in the flow control valve must be set to a maximum operating pressure which is higher than the operating pressure to be controlled using PMV 41-4./.. or PMVP 4-4./.. and can be considered a maximum pressure safeguard mechanism.

6.5 Accessories, spare and individual parts

Accessories, spare and individual parts To purchase spare parts, please see [Hawe Hydraulik interactive contact map](#).
